

The goal of this assignment is to make you get familiar with the reading documentation and editing features accordingly.

Material UI is a react component library. You have to add code to customize Material UI components without using `withStyles` or `makeStyles` hooks provided by Material UI. Please read the instructions carefully and stick to them. Any other solution or partial solution to this problem even if it's efficient won't be accepted as this task is meant to test specific analytical skills and not coding skills. You can always get help from us.

1. Use only plain CSS or SCSS to customize Material UI components.
2. Create a .jsx file for the text field component and import a .css or .scss file to customize the text field component.
3. Change the border color of an outlined text field component from Material UI to #1d72e7. Please use the component from this URL  
<https://mui.com/material-ui/react-text-field/#BasicTextFields.js>
4. Make sure the border does not overlap the label when you focus on the text field.
5. Upload the code to GitHub and share the URL.
6. Host the website in any of the platforms like netlify, github pages or heroku and share the link.
7. Make sure to add a readme file along with a screenshot of the text field component with the changed color.
